Sequence 351, Application US/09949002

Patent No. 690016

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH INFLAWMATORY AUTOIMMUNE DISEASE, METH
TITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: CL000790
CURRENT APPLICATION NUMBER: US/09/949,002
CURRENT FILING DATE: 2000-01-28
PRIOR APPLICATION NUMBER: 60/231,401
PRIOR FILING DATE: 2000-09-08
NUMBER OF SEQ ID NOS: 10823
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 351
LENGTH: 786
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ; ORGANISM: Human

or a tetragonal space group. New crystal of protein kinase B beta, useful for activating protein kinases, e.g. AGC kinases, comprises three-dimensional atomic coord coordinates

Claim 32; Page 265; 284pp; English.

The present invention describes a crystal of protein kinase B beta (PKBbeta) comprising (I), where (I) comprises: (a) a tetragonal space group P4-1-2-1-2 and unit cell dimensions of: a = 149.33 plus or minus 0.5 Angstrom, b = 149.33 plus or minus 0.5 Angstrom, c = 39.77 plus or minus 0.5 Angstrom, b = 148.40 plus or minus 0.5 Angstrom, b = 148.40 plus or minus 0.5 Angstrom, c = 38.55 plus or minus 0.5 Angstrom; a =

(I) has cytostatic, antidiabetic, vasotropic, nootropic and neuroprotective activities, and can be used in gene therapy. The crystal of PKBbeta, and methods from the present invention, are useful in activating protein kinases, particularly AGC kinases, for identifying modulators of protein kinases activity, and for structural analysis of other protein kinases. The crystal may also be used in manufacturing a medicament for treating cancers, diabetes, erectile dysfunction or neurodegeneration. The present sequence represents a peptide which can be used in a method from the present invention to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Angstrom,

                                  The present invention describes a method (M1) for selecting or designing a compound for modulating the activity of phosphoinositide dependent protein kinase 1 (PDK1) comprising using molecular modelling means to select or design a compound that is predicted to interact with the protein kinase catalytic domain of PDK1, and selecting a compound that is
                                                                                                                                                                                                                                                                                                                            Selecting/designing compound for modulating activity of phosphoinositide dependent protein kinase 1 by using molecular modelling to select/design compound predicted to interact with protein kinase catalytic domain.
                                                                                                                                                                                                                                                               Disclosure; Page 17;

Three-dimensional protein coordinate data is given in the specification. Also disclosed is a method for determining the structure of a PKB derivative, analysing a PKBbeta-ligand complex, determining a three-dimensional structure for a target kinase, and a computer system or computer-readable media containing atomic coordinate data listed in the specification. The crystal of PKBbeta, and methods are useful in activating protein kinases, particularly AGC kinases, for identifying modulators of protein kinases activity, and for structural analysis of other protein kinases. The crystal may also be used in manufacturing a medicament for treating cancers, diabetes, erectile dysfunction or neurolegeneration. The current sequence represents a peptide used in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical; cell signaling; chemotherapy; AGC kinase related cancer; diabetes; neurodegenerative disease; Alzheimers disease; Parkinsons disease; AIDS associated dementia;
